asase gyefo

PREMIUM ORGANIC FERTILIZER®

Application Manual
Farm Field

What can I use Asase Gyefo for?

Asase Gyefo Premium Organic Fertilizer is a nutrient-rich and PPRSD-certified product. It is suitable for all types of plants and crops, from food to flowers. It can be applied in agriculture, landscaping and horticulture, in the open field, in greenhouses and in potting media.

ON THE FARM FIELD

How much do I need to apply on the farm field?

One bag of Asase Gyefo contains 30 kg of organic fertilizer. You need approximately 8 - 10 bags (240-300 kg) per plot and between 40 and 50 bags (1200 -1500 kg) per acre, depending on the health and quality of the soil. For sandy soils with little organic matter or heavy clay soils with poor drainage, you need more, at least 50 - 55 bags (1500 - 1700 kg) per acre.

Asase Gyefo is optimised for all different types of crops. The amount needed differs per crop though. For onions, lettuce, carrots, cabbage and tomatoes, generally crops with fibrous roots, need a lesser amount of Asase Gyefo as compared to maize sorghum, millet, hot pepper, garden eggs and okra. When using Asase Gyefo, you don't need to apply additional nutrients, it contains all macro and micronutrients needed for plants' growth.

When to use Asase Gyefo on the field?

You need to apply Asase Gyefo 7 to 14 days before planting. Asase Gyefo feeds the land. The nutrients stay in the soil for longer periods compared to inorganic fertilizers. That is why you don't need to repeat the application of Asase Gyefo at every crop season or every planting time. Especially after the second harvest, you start noticing the increase in yields.

How to apply Asase Gyefo on the farm field?

1. Broadcasting method:

If the application is done by broadcast, as shown in the picture, the best way is to plough the land first. After ploughing, you evenly spread the Asase Gyefo on the land manually. After that, you may harrow if needed. Do not plant or transplant immediately after application. Water the applied field at least three times before planting or transplanting, if it is not raining. In case you already started planting, you can still apply Asase Gyefo and get the benefits to give the soil a boost of micro and macronutrients.

2. Application per region/ bed

Spread a layer of Asase Gyefo evenly on vegetables and flower beds, with about 3 cm thickness. Uniformly incorporate it into the soil of the new beds about 1 to 2 weeks before planting.

3. Application per plant

To apply per plant, you can use an empty milk tin which is equivalent to (150g - 200g) of Asase Gyefo per plant. Water thoroughly after planting.
