asase gyefo

PREMIUM ORGANIC FERTILIZER®

Application Manual

Greenhouses

Asase Gyefo Premium Organic Fertilizer is a nutrient-rich and PPRSD-certified product. It is suitable for all types of plants and crops, from food to flowers. One bag of Asase Gyefo contains 30 kg of organic fertilizer. It can be applied in agriculture, landscaping and horticulture, in the open field, in greenhouses and in potting media.

IN THE GREENHOUSE

How much do I need to apply in the greenhouse?

When using Asase Gyefo in the greenhouse, make sure you always mix it with soil, coco peat, or some other substrate (like sawdust). You don't need to apply additional nutrients, it contains all macro and micronutrients needed for plants' growth. The amount needed differs per crop though. For onions, lettuce, carrots, cabbage and tomatoes, generally crops with fibrous roots, need a lesser amount of Asase Gyefo as compared to maize sorghum, millet, hot pepper, garden eggs and okra.

In case you plant **directly into the soil in the greenhouse**, you apply at the rate of 40-50 bags per acre, depending on the size of the greenhouse. Asase Gyefo feeds the soil. The nutrients stay in the soil for longer periods compared to inorganic fertilizers. That is why you don't need to repeat the application of Asase Gyefo at every crop season or every planting time. Especially after the second harvest, you start noticing the increase in yields.

In case you plant in buckets in the greenhouse, depending on the substrate you use, you need to apply different amounts. In case you use coco peat, you need to mix 4 units of coco peat with 1 unit of Asase Gyefo. In case you use soil, then the ratio would be 5 / 1 units of topsoil and Asase Gyefo respectively.

Please note: When too much Asase Gyefo is applied, the seeds may not germinate and the plant may wilt, wither or die due to excessive nutrient intake.

IN THE NURSERY

When applying Asase Gyefo in the nursery, please incorporate a 4cm layer of Asase Gyefo into the 10cm top soil layer. Mix it well, and water it before nursing your seeds.
In case you use potting media or container plants to nurse your seeds, depending on the substrate you use, you need to apply different amounts. In case you use coco peat, you need to mix 5 units of coco peat with 2 units of Asase Gyefo. In case you use soil, then the ratio would be 5 / 1 units of topsoil and Asase Gyefo respectively.

When to apply Asase Gyefo?

For both greenhouses and nurseries, you need to prepare the mixture of Asase Gyefo and substrate 7-14 days before planting, and water it a few times.
